

Add up all HIGH Numbers and all LOW Numbers. For example, if ten drawings produce 22 HIGH Numbers and 38 LOW Numbers, the result would be $L=+16$. This means that 16 more LOW Numbers were drawn than HIGH Numbers during

the last ten games. **An $L=+16$ tells you that you should play more HIGH Numbers because the last ten games had 16 more LOW than HIGH numbers.** In the case, there is a tendency that the trend is likely to reverse from LOW to HIGH numbers in the coming draws.

SUM CHART BIAS TRACKER™

In Singapore Toto 6/45, the Most Probable Sum is 138, and the Most Probable Range is 106 - 170. You are more likely to win if the sum of the numbers (ie the sum of six Toto numbers) you play falls within the Most Probable Range. So try to pick your Toto numbers, where the total sum is between 106 -170 points.

The SUM of the six Toto numbers is derived by adding up the six numbers in a draw. For example, 04, 10, 12, 19, 20, 31, 42 equalled to 138.

Pages 27-29, 36-38 in the Lottery Master Guide give full details on the High-Low, Sum Frequency, Most Probable Sum and Most Probable Range. Read it to fully understand the Sum Frequency and the Most Probable Range of Sums Charts for the Toto game.

*Watch out for the next issue, we will briefly explain Gail Howard's method of numbers selection, using the fourth and fifth tracker, the **NUMBER GROUPS BIAS TRACKER™** and **HOT-COLD BIAS TRACKER™** to pick your winning Toto numbers.*
